All new process models and methods spur discussion and debate around the world

The codependent nature of XP is both its strength and weaknesses

Many organizations only adopt a subset of XP -- weakening its efficacy

- Requirements volatility
 - The customer is an active member of the XP team, meaning that requirements are requested informally
 - The scope of the project can change and earlier work may have to be modified to accommodate current needs
- Conflicting customer needs
 - Projects have multiple customers with different needs that might conflict lol
- Requirements are expressed informally
 - User stories and acceptance tests are the only explicit manifestation of XP requirements
 - Critics argue that a more formal model or specification is often needed to ensure that omissions, inconsistencies, and errors are uncovered before the system is built.
- Lack of formal design
 - XP deemphasizes the need for architectural design and in many instances suggests that design of all kinds should be informal
 - Critics argue that when complex systems are built, design must be emphasized to ensure the overall structure of the software will exhibit quality and maintainability
